

ID06-lift gives safer construction sites

The handling of lifts on construction sites can now be made easier thanks to a developing project accomplished by SafeTool and Lipac Liftar.

Lipac Liftar is one of the biggest renters of lifts in Sweden. Lipac Liftar and SafeTool have developed the first lift in the world, which can be run by an ID06-card as a personal key.

This system makes it easier to comply with the more and more strict laws regarding the work environment. Since July 2007 a documented knowledge and proficiency is needed to handle lifts in Sweden. Our project is a step forward to create a new cooperation

between building contractors and machine renters. In the first hand we do this to increase security but also to create innovations and solutions to improve the building trade. The product is estimated (to be ready for delivery during the autumn of 2009).

THE PRINCIPAL FUNCTIONS ARE:

- Fully compatible with ID06
- A unique system – the only in Sweden to admit competent lift drivers.

- Increased safety according to the fact that the correct driver, with a correct education uses the actual lift.
- This system contributes to a decreased number of industrial accidents.
- Fully compatible with SafeTool Information System (SIS), standard software for safer construction sites in Sweden.
